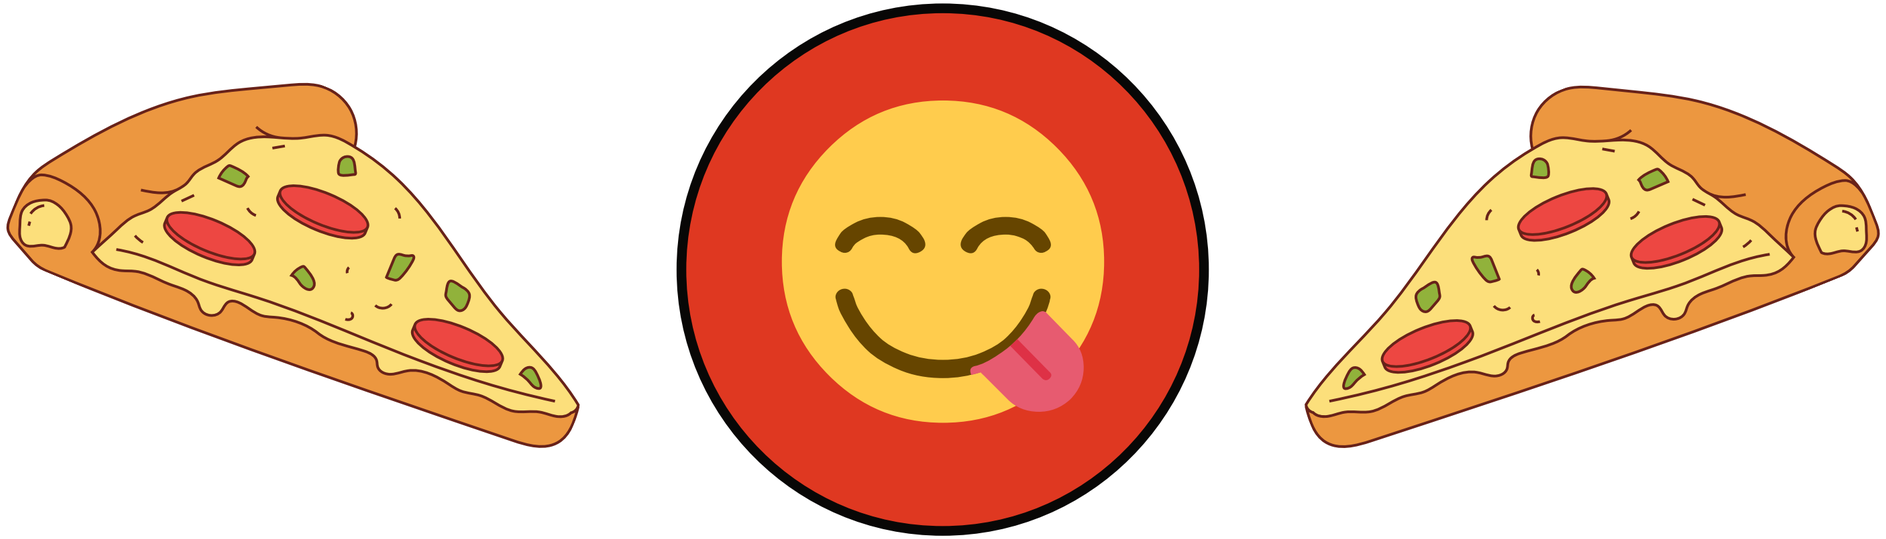
END TO END SQL PROJECT

Pizza Sales Analysis



This pizza is amazing

Introdution

Hello,I am Ajeet Dubey.
In our SQL end-to-end project,I conducted a comprehensive analysis of pizza sales.The project involved extensive use of SQL queries, with a primary focus on join operations to combine data from multiple tables. We utilized inner joins, left joins, and right joins to analyze sales trends, customer demographics, and product performance. The dataset included tables for orders, customers, pizzas, and transactions, enabling us to derive insights into sales patterns and business growth. This project showcased the practical application of SQL in real-world data analysis and decision-making.

Pizzahut Table

- Order_details
- Pizzas
- Orders
- Pizza_types

```
create database pizzahut;

use pizzahut;

create table orders(
order_id int not null,
order_date date not null,
order_time time not null,
primary key (order_id));

create table order_details(
order_details_id int not null,
order_id int not null,
pizza_id text not null,
quantity int not null,
primary key (order_details_id));
```

Retrieve the total number of orders placed.

```sql
SELECT
    COUNT(order_id) AS total_orders
FROM
    orders;
```

output-->

Result Grid

	total_orders
▶	21350

Calculate the total revenue generated from pizza sales.

```
SELECT
    ROUND(SUM(order_details.quantity * pizzas.price),
            2) AS total_sales
FROM
    order_details
        JOIN
    pizzas ON pizzas.pizza_id = order_details.pizza_id;
```

Result Grid
